* NOTE: This is a "working draft" sequence. It currently

* consists of 43 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N. but the exact sizes of the gaces such on whoow.

* This record will be updated which the finished sequence

* as soon as it is available and the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Submitted (01-SEP-2000) Production Sequencing Facility, DOE Joint Genome Institute, 2800 Mitchell Drive, Walnut Creek, CA 94598, USA

This coding sequence was isolated from the CI-215 human glioma cell line. It was incorporated into an appropriate vector to transform Saccharomyces cerevisiae or E.Coli. Monomeric TGF-betal was purified, denatured and dissolved in 140ml 50mm Tris/HCl pH8. IM NaCl, 5mm EDTA, 2mm reduced glutathione, 1mm oxidised glutathione and 33mm Chaps. After 72 hrs at 4 deg C, pH was adjusted to 2.5 and the mixture was conc. 10 times. The conc. soln was diluted to the original vol. with 10mm HCl and conc to a final vol of 10 ml. The supernatant from
                                                                                                                                                                                                                                                                     Prodn. of Transforming Growth Factor type-beta-like proteins subjecting denatured monomeric form to refolding conditions

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. The hybrid melecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue. See e.g. AAQ41602-Q41607 for pref. hybrids. New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc. nTGF-beta3; hybrid protein; wound healing; cancer treatment; bone repair; growth regulation; ss. seq\_name: /SIDS1/gcgdata/geneseq/geneseqn/NA1993.DAT:AAQ41601 Sequence 339 BP; 74 A; 104 C; 86 G; 75 T; 0 other; Mature human Transforming Growth Factor-beta3, 301 CTCTCCAACATGGTGGTGAAGTCTTGTAAATGTAGC 336 Kuhla J; Location/Qualifiers 1..336 /\*tag= a Cerletti N, Claim 4; Page 24; 48pp; English. seq\_documentation\_block:

```
The coding sequence (AAT17234) of human transforming growth factor TGF-beta 3 (AAR92772) was cloned into plasmid pGEM-52F(+) (Promega) and the construct used to transform E. coli Y1090. Subcloning in pPLMu yielded plasmid pPLMu.hTGF-beta 3. Non-soluble, monomeric TGF-beta 3 was recovered from E. coli LC 137/ppLMu.hTGF-beta 3 (DSM FGFS) transformants. A biologically active, dimeric form of TGF-beta 3 was obtd. by refolding this monomer in detergent-free buffer contg. DMSO and/or DMF. Dimers of TGF-beta 1 (AAR92773) and TGF-beta 2 (AAR92774), and hybrid dimers (see also AAR927775-77), were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Prodn. of dimeric biologically active transforming growth factor by refolding denatured monomer in detergent-free folding buffer contg. specific organic solvent to improve yield

AATI5462-T15464 encode transforming growth factor (TGF) beta-1,
TGF beta-2 and TGF beta-3 which are produced using recombinant
DNA technology and used to produce TGF beta-like proteins in
Cdimeric form. The TGF beta-like proteins produced are hybrids of
C different types of TGF beta e.g. TGF beta-13, TGF beta-23, etc.
C different types of TGF beta e.g. TGF beta-1-3, TGF beta-2-3, etc.
C and eusing a new process of producing dimeric, biologically active
TGF beta monomers with folding buffer contg. a mild detergent (CHAPS,
CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl
C sulphoxide), DMSO2 (dimethylsulphone) and DMF (dimethyl formamide).
C The detergent allows folding of the monomer such that, after
dimerisation, the TGF beta-like protein retains biological activity
and remains in soluble form. The method allows relatively high yields

WPI; 1997-145621/13. P-PSDB; AAW26173 Crystalline form of transforming growth factor beta-3 - useful in compsns. as slow release form of TGF, e.g. for wound healing, and for structure determn. in rational drug design

Example 1; Page 25-26; 34pp; English.

This sequence represents the coding sequence for human transforming growth factor beta3 (TGF-beta3 is one of five distinct homodimeric TGFDeta's. TGF-beta3 is a acid-stable and heat-stable disulphide linked homodimer. All the TGF-beta's are produced as 390-412 amino acid precursors, which undergo proteolytic cleavage to produce mature forms which consist of the C-terminal 112 amino acids. Depending upon cell and tissue type, and the presence of other growth factors, TGF-beta may either stimulate mitogenesis, cell proliferation and growth, or inhibit these processes. Many of the actions of TGF-beta are related to the response of cells or tissues to stress or injury, and to the repair of resultant damage. A crystalline form of TGF-beta3 is useful in produced by a method of the invention. Crystalline TGF-beta3 is useful in slow release compositions for treatment of conditions such as wounds, calls in intestinal mucositis, osteoarthritis, bone disease and repair, generally wherever TGF-beta3 is normally used. The crystalline form is also used for structure determination in rational drug design. adsorb on the walls of vials and is more stable against oxidation. Variation of the properties, e.g. size, of the crystals allows control over the rate at which active TGF is released in vivo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprises a purification tag and a TGF active fragment. The present sequence encodes a specifically claimed TGF active fragment. Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site:ECM binding site:proteinase site:TGF-beta. TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       novel transforming growth factor-beta (TGF-beta) fusion protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TGF active fragment of a TGF-beta fusion protein encoding cDNA

recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteiness site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the desired site of action. Delivery of the TGF-beta to the site to be treated reduces the amount of TGF-beta required to be administered to be effective and reduces the concentration of circulating TGF-beta which may result in undesirable effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cDNA encoding the mature form of transforming growth factor-beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Transforming growth factor-beta-3; TGF-beta-like protein; S-sulphonated TGF-beta-like protein; wound treatment; cancer; bone repair; tissue repair; bone marrow protective agent; cardioprotection; anti-inflammatory; immunosuppressive; ulcer; bed sore; ds.

```
The present sequence encodes the mature form of transforming growth factor-beta-3. Dimeric, biologically active TGF-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-subjehonated TGF-beta-like protein is useful for the production of the dimeric, biologically active TGF-beta-like protein, which is useful for the treatment of wounds (surface or internal) and cancer in a mammal, in bone and tissue
                                                                                                                                                                                                                                                                                                                                                                                                                  repair, as a bone marrow protective agent, a mediator of cardioprotection, for the production of an anti-inflammatory or immunosuppressive preparation. Treatment is useful for animals, especially humans, and wound treatment (e.g. ulcers, bed sores etc.) is particularly useful for the elderly.
                                                                                                                                                                                                                      refolding new monomeric Transforming Growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  luProLeuThrIleLeuTyrTyrValGlyArgThrProLysValGluGln 100

```
The present sequence encodes a transforming growth factor beta active fragment. The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins are purification and some or all of the following elements: a purification tag, a proteinase site, an ECM/bone binding site, a second proteinase site, and a bone morphogenetic protein active fragment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New bone morphogenetic fusion proteins - comprising a purification tag and a bone morphogenetic active fragment, used for enhancing wound healing or bone growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               20

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene product may be used to inhibit growth of tumour cells, to treat proliferative type disorders, burns and other wounds, and may also be used as an immune modulator. Detection of proteins and of TGF-alpha can indicate presence of a tumour.

Proteins may be produced from a bacterial or eukaryotic expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cancer; carcinoma; melanoma; leukaemia; arteriosclerosis; psoriasis;

The present sequence encodes human transforming growth factor-beta 3 (TGF-beta3). The specification describes a composition for regulating trophoblast invasion which comprises an inhibitor of TGF-beta 1. TGF-beta family cytokine receptors, hypoxia inducible factor 1 alpha (HIF-1 alpha) or oxygen tension. The composition is used in methods of diagnosing, monitoring, preventing or treating conditions requiring regulation of trophoblast invasion, especially preeclempsia in pregnant
                                                                                                                                                                                        Regulation of trophoblast invasion - by, e.g. transforming growth factor-beta3 inhibitor, useful for detecting or treating preeclempsia in pregnant women

                                                                  101
                                                                                                                                                                                                         The specification describes a method for growing stem cells. The method involves providing stem cells with supporters which are genetically modified in order to provide externally regulatable interactions between the supporters and the stem cells, and applying an external signal for starting or stopping the interactions. The cells are useful for curing diseases by gene therapy and/or cell therapy in combination with tissue engineering, when the functional expression of stem cells is helped with engineered architecture of the tissue, which diseases are related to insufficient and/or lack and/or disorders of stem cells. The present sequence represents a vector, which is used in the method of the

cDNA sequences were determined for human pre-TGF-beta-1 (AAQ56923), pig TGF-beta-3 (AAQ56926), and the corresponding amino acid sequences were determined (AAG56927-29, respectively). A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the onstruction of vectors for the expression of recombinant TGF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         278 GCTTTGGACACCAATTACTGCTTCCGCAACTTGGAGGAGAACTGCTGGT 327

```

This nucleotide sequence, hu4, codes for a human partial transforming growth factor-beta 3 (TGF-beta 3) sequence including

```
all of the mature sequence. Clone hu4 was isolated from a human ovarian cDNA library using porcine TGF-beta 3 cDNA (see AAV52934) as probe. The invention relates to the recombinant production of TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition of neophastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into vectors which are replicated in bacteria and expressed in euclaryotic cells. TGF-beta recovered from transformed cells is used in known therapeutic applications. TGF-beta nucleic acids are also used in diagnosis and identification of TGF-beta clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              growth factor beta-3 (TGF beta 3); tumour cells; growth

This sequence has been compiled from the description of a mutant TGF-beta3 contained in the claims. The sequence coding for the Factor Xa cleavage site may be replaced by one encoding a similar protease recognition site, e.g. for collagenase. The coding sequence may also include a region encoding a hydrophobic transmembrane amino acid sequence, e.g. from c-erbB2 cDNA and a "stop transfer" sequence. The protease recognition site is located between the C-terminal of the transmembrane region and the N-terminal of the TGF-beta 3 precursor. Mature TGF-beta 3 can then be efficiently cleaved from the membrane. See also AAQ20576 and AAR20622.
                                                                                                                                                                                                                                             /*tag= d

   This sequence encodes human transforming growth factor-beta 3 (TGF-beta 3) polypeptide. The nucleic acid sequence encoding this subtype is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.
                                                                                                                                          ø
                                                                                                                                     Nucleotide sequence encoding transforming growth factor beta-3 -used as probe; or to produce TGF beta 3, for inhibition of growth of normal and neoplastic cells, eg A549.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                67
This nucleotide sequence, termed 10+11.3, codes for the porcine transforming growth factor-beta 3 precursor (preTGF-beta 3, see AAW78786). A porcine ovarian cDNA library was screened using human TGF-beta 1 cDNA (see AAW52933) as probe. A hybridising clone, designated lambda 11.3, was used to rescreen the library to identify clone lambda 10. The was combined with clone lambda 11.3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 precursor sequence -

to provide the 10+11.3 sequence. The invention relates to the recombinant production of TGF-beta. Biologically active TGF-beta is defined as being capable of inducing EGF-potentiated anchorage independent growth of target cell lines and/or growth inhibition of meoplastic cell lines. Nucleic acids encoding TGF-beta have been isolated and cloned into vectors which are replicated in bacteria and expressed in eukaryotic cells. TGF-beta recovered from TGF-beta nucleic acids are also useful in diagnosis and identification of TGF-beta clones.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TGF-beta-1; TGF-beta-2; transforming growth factor beta-1; transforming growth factor beta-3; recombinant; wound healing;

cDNA sequences were determined for human pre-TCF-beta-1 (AAQ56923), plg TGF-beta-3 (AAQ56925) and human TGF-beta-3 (AAQ56926), and the corresponding amino acid sequences were determined (AAR46227-29, respectively). A genomic fragment corresponding to a human TGF-beta-1 exon (AAQ56924) was also isolated and its amino acid sequence determined (AAR46230). The sequences have been used in the construction of vectors for the expression of recombinant TGF-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence encodes a 112 amino acid tumor growth inhibitor (TGI) (AAR86770) or a 205 precursor TGI (AAR86771) comprising TGI with an additional 93 amino acid residues at the N-terminus. However, the nucleotides representing codons -40 to -1 of the precursor TGI are not specified in Figure 29, i.e. the cDNA is 498 nucleotides in length, but should be 615 nucleotides long. The DNA is used to produce the inhibitors by recombinant methods i.e. vector expression in bacterium or eukaryotic host cells. The proteins can be used to inhibit the growth of human tumour cells, e.g. carcinoma, melanoma or leukamenia cells, in the treatment of proliferative disorders e.g. arteriosclerosis, inflammation and proliferative disorders e.g. arteriosclerosis, inflammation and pooriasis, or for the treatment of burns to facilitate wound

This sequence encodes porcine transforming growth factor-beta 3 (TGF-beta 3) polypeptide. The nucleic acid sequence encoding this subtype is useful as a probe or to produce TGF-beta 3 for both normal and neoplastic cell growth inhibition.
                                                                                                                                                                                                                                                                                                                                                                                                            Nucleotide sequence encoding transforming growth factor beta-3 -used probe, or to produce TGF beta 3, for inhibition of growth of normal and neoplastic cells, eg A549.
                                                                                                               Transforming growth factor beta-3 (TGF beta 3); tumour cells; growth inhibition.

                                                                                                                                                                                                                                                                     The plasmid was isolated from a human cDNA library prepd. from the DNA of a chronic myelocytic leukaemia cell line (K562). The sequence can be used to produce the tumour growth inhibitor (TGI) by recombinant techniques. The protein may also be isolated from human umbilical cord and placental tissues. It can be used to inhibit tumour cell growth, to treat burns, to facilitate the healing of wounds or to treat proliferative disorders. The protein and Abs raised to it can be used for detection and typing the TGI.
                                                                                                                                                                             Tissue-derived tumour growth inhibitors - comprise specified protein sequences used to detect, and treat tumours, burns and

```
The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41601 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hyprids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta1(44/45)beta3. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and full-takeness incisional wounds and scenarios.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hybrid transforming growth factor-beta molecules - comprise

A DNA sequence (AAT17237) codes for a recombinant hybrid of human transforming growth factor-beta, TGF-beta 1-3 (AAR92775), in which the N-terminal 44 amino acids are from TGF-beta 1 (see also AAR92773) and the C-terminal 68 amino acids from TGF-beta 3 (see also AAR92772). The DNA was subcloned in pPLMu, yielding plasmid pPLMu.hTGF-beta 1 (44.45)beta3. Non-soluble, monomeric hybrid TGF-beta 1-3 was recovered from E. coli transformants. A biologically active, dimeric form of the hybrid was obtd. by refolding the monomer in detergent-free buffer contg. DMSO and/or DMF. Hybrid dimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Prodn. of dimeric biologically active transforming growth factor by refolding denatured monomer in detergent-free folding buffer contg. specific organic solvent to improve yield

AAT15465 encodes transforming growth factor (TGF) beta-like protein, TGF-beta-1-3. TGF beta-1-3 is a hybrid of TGF-1 and TGF-3. TGF beta hybrids were made using a new process of producing dimeric, blologically active TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins. The new process involves treating denatured TGF beta-like proteins. The new process involves mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxide), DMSO2 (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional regulators of cellular activity and a typical use is to stimulate wound
                                                                                                                                                                                                                                                                                                                                 factor
                                                                                                                                                                                                                                                                                                                           Prodn. of dimeric, biologically active transforming growth f

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41600 and AAQ41601. TGF-beta2, TGF-beta2 and TGF-beta3 (see AAQ41599, derived from different parent isoforms are pref. between parts possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta2(44/45)beta3. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.
                                                                                                                                                                                                                                                                                                                           Location/Qualifiers

A DNA sequence (AAT17238) codes for a recombinant hybrid of human transforming growth factor-beta, TGF-beta 2-3 (AAR92776), in which the N-terminal 44 amino acids are from TGF-beta 2 (see also AAR92774) and the C-terminal 68 amino acids from TGF-beta 3 (see also AAR92772). The DNA was subcloned in pPLMu, yielding plasmid pPLMu.hTGF-beta 2 (44/45)beta3. Non-soluble, monomeric hybrid TGF-beta 1-3 was recovered from E. coli LC137 transformants. A biologically active, dimeric form of the hybrid was obdd. by refolding the monomer in detergent-free buffer contg. DMSO and/or DMF. Hybrid dimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Prodn. of dimeric biologically active transforming growth factor by refolding denatured monomer in detergent-free folding buffer contg. specific organic solvent to improve yield

AAT15466 encodes transforming growth factor (TGF) beta-like protein, TGF-beta-2-3. TGF beta-2-3 is a hybrid of TGF-2 and TGF-3. TGF beta byblids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta-nonemers with folding buffer contg. a mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxide), DMSO2 (dimethylsulphoxel) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional requiators of cellular activity and a typical use is to stimulate wound
                                                                                                                                                                                                                                                                                                                                        Prodn. of dimeric, biologically active transforming growth f

The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred, esp. the hybrid TGF-beta3(44/45)beta2. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue.

See AAQ41602-Q41606 for the other pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.
                                                                                                                                                                                                                                                                                                                                                  /*tag= a

A DNA sequence (AAT17239) codes for a recombinant hybrid of human transforming growth factor-beta, TGF-beta 3-2 (AAR92777), in which the N-terminal 44 amino acids are from TGF-beta 3 (see also AAR92772) and the C-terminal 68 amino acids from TGF-beta 2 (see also AAR92774). The DNA was subcloned in pPLMu, yielding plasmid pPLMu.hTGF-beta 3(4445)beta2. Non-soluble, monomeric hybrid TGF-beta 3-2 was recovered from E. coli LC137 transformants. A biologically active, dimeric form of the hybrid was obtd. by refolding the monomer in detergent-free buffer contg. DMSO and/or DMF. Hybrid dimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prodn. of dimeric biologically active transforming growth factor
by refolding denatured monomer in detergent-free folding buffer
contg. specific organic solvent to improve yield

```
AAT15467 encodes transforming growth factor (TGF) beta-like protein, TGF-beta-3-2. TGF beta-3-2 is a hybrid of TGF-3 and TGF-2. TGF beta blybrids were made using a new process of producing dimeric, biologically active TGF beta-like proteins. The new process involves treating denatured TGF beta monomers with folding buffer contg. a mild detergent (CHAPS, CHAPSO or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxide), DMSO2 (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimerisation, the TGF beta-like protein retains biological activity and remains in soluble form. The method allows relatively high yields of biologically active TGF beta-like proteins in their native dimeris form, TGF-beta like proteins are multifunctional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               requiators of cellular activity and a typical use is to stimulate wound

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention covers hybrid TGF-beta molecules consisting of parts AQ41509 of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ4159), AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms, 6 are preferred including the hybrid TGF-beta1(44/45)beta2. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and full-traisme. See also AAQ41603-Q41607 for the other pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /*tag= a

                                                                                                                                                                                                                                                            AAQ41602;
```

NO YOU COULD COULD BE A STANK A STANK

```
The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41600 and AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1..336

44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. Of the 30 possible hybrids using these hinge points and one part each from two of the isoforms; 6 are preferred including the hybrid TGF-beta3(44/45)beta1 The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue. See AAQ41602-Q41607 for the most pref. hybrids.

This coding sequence was isolated from the CI-215 human glioma cell line. It was incorporated into an appropriate vector to transform Sacchamyces cerevisiae or E.Coli. Monomeric TGF-betal was purified, denatured and dissolved in 140ml 50mm Tris/HCl pH8. IM NaCl, 5mM EDTA, 2mM reduced glutathione, 1mM oxidised glutathione and 33mM Chaps. After 72 hrs at 4 deg C, pH was adjusted to 2.5 and the mixture was conc. 10 times. The conc. soln was diluted to the original vol. with 10mM HCl and conc to a final vol of 10 ml. The supernatant from centrifugation at 5000g for 30 min contained disulphide-linked dimeric
                                                                                                                  bγ
                                                                                                                Prodn. of Transforming Growth Factor type-beta-like proteins subjecting denatured monomeric form to refolding conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          150
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             250

```
The invention covers hybrid TGF-beta molecules consisting of parts of the human isoforms TGF-beta1, TGF-beta2 and TGF-beta3 (see AAQ41599, AAQ41601, respectively). The hinge points between parts derived from different parent isoforms are pref. between amino acids 44 and 45, 56 and 57, 79 and 80, 90 and 91, or 22 and 23. The hybrid molecules promote cell migration, inhibit the growth of A375 melanoma cells, accelerate the healing of partial-thickness burn wounds and full-thickness incisional wounds and increase formation of fibrous granular tissue. See e.g. AAQ41602-Q41607 for pref. hybrids.
                                                                                                                                                                                                                                                                                                                                                                                          New hybrid transforming growth factor-beta molecules - comprise portions of mature TGF-beta isoforms; useful as wound healants, cardioprotective, antiinflammatory and immunosuppressive agents etc.

The coding sequence (AAT17236) of human transforming growth factor TGF-beta 2 (AAR92774) was cloned into plasmid pGEM-52F(+) (Promega) and the construct used to transform E. coli Y1090. Subcloning in pPLMu yielded plasmid ppLMu.hTGF-beta 2. Non-soluble, monomeric TGF-beta 2 was recovered from E. coli LC 137/ppLMu.hTGF-beta 2 (DSM 5657) transformants. A biologically active, dimeric form of TGF-beta 2 was obtd. by refolding this monomer in detergent-free buffer contg. DMSO and/or DMF. Dimers of TGF-beta 1 (AAR92773) and TGF-beta 3 (AAR92772), and hybrid dimers (see also AAR92775-77), were

or bone morphogenic proteins e.g. BMP-2. The TGF beta hybrids were made using a new process of producing dimeric, biologically active TGF beta-1ike proteins. The new process involves treating denatured TGF beta monomers with folding buffer contg. a mild detergent (CHAPS, CHAPS, or digitonin) and at least one of the solvents DMSO (dimethyl sulphoxide), DMSO2 (dimethylsulphone) and DMF (dimethyl formamide). The detergent allows folding of the monomer such that, after dimethyl the TGF beta-like protein retains blological activity and remains in soluble form. The method allows relatively high yields of blologically active TGF beta-like proteins in their native dimeric form. TGF-beta like proteins are multifunctional regulators of ellular activity and a typical use is to stimulate wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TGF active fragment of a TGF-beta fusion protein encoding cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transforming growth factor-beta fusion protein; wound healing; artificial skin; surgery recovery time; ss.

       AAT15462-T15464 encode transforming growth factor (TGF) beta-1, TGF beta-2 and TGF beta-3 which are produced using recombinant DNA technology and used to produce TGF beta-1ike proteins in dimeric form. The TGF beta-1ike proteins produced are hybrids of 2 different types of TGF beta e.g. TGF beta-1-3, TGF beta-2-3, etc,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Prodn. of dimeric, biologically active transforming growth factor beta - by refolding denatured monomer in buffer contg. mild detergent and specific organic solvents to improve yields

A novel transforming growth factor-beta (TGF-beta) fusion protein comprises a purification tag and a TGF active fragment. The present sequence encodes a specifically claimed TGF active fragment.

C Additionally, the fusion protein may comprise proteinase-sensitive linker sites and binding domain so the protein sequence may contain some or all of the following elements: purification tag:proteinase site: ECW binding site:proteinase site:TGF-beta TGF-beta promotes wound healing, and the fusion protein can be used to reduce surgery recovery time and in the preparation of artificial skin. The inclusion of a purification tag facilitates purification of the fusion protein. The proteinase site is included to permit cleavage and release of the purification tag after purification if desired. The extracellular matrix binding site facilitates delivery of the fusion protein to the cleared site of action. Delivery of the TGF-beta to the site to be traced to trace and the amount of TGF-beta required to be administered to
                                                                                                                                                                                                                                                                                                                                                                                            Prepn. of transforming growth factor-beta fusion protein - useful to reduce surgery recovery time and to prepare artificial skin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      be effective and reduces the concentration of circulating {\tt TGF-beta} which {\tt may} result in undesirable effects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 339 BP; 98 A; 77 C; 70 G; 94 T; 0 other;

WPI; 1999-083520/08 P-PSDB; AAW97092 Producing biologically active dimeric Transforming Growth Factor-beta - by refolding new monomeric Transforming Growth Factor-beta, useful for treatment of wounds and cancer

Example 1; Page 29; 32pp; English.

The present sequence encodes the mature form of transforming growth factor-beta-2. Dimeric, biologically active TGF-beta-like protein can be produced by subjecting the denatured monomeric form to refolding conditions. The new monomeric S-sulphonated TGF-beta-like protein is useful for the production of the dimeric, biologically active (surface or internal) and cancer in a mammal, in bone and tissue repair, as a bone marrow protective agent, a mediator of cardioprotection, for the production of an anti-inflammatory or faminosouppressive preparation. Treatment is useful for animals, especially humans, and wound treatment (e.g. ulcers, bed sores etc.) is particularly useful for the elderly.

The present sequence encodes a transforming growth factor beta active fragment. The protein can be used in place of a bone morphogenetic active fragment to create the fusion proteins of the invention. When a bone morphogenetic active fragment is used, the fusion proteins are designated bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic fusion proteins. The bone morphogenetic proteins are purification and proteins sale for the following elements: a proteinase site, and a bone morphogenetic protein active fragment. The bone morphogenetic fusion proteins can be used for enhancing wound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               macrophage inducible nitric oxide synthase; iNOS; constitutive NOS; interleukin-1-beta; transforming growth factor-beta; TGF-beta; IL1-beta; nitric oxide production; hypotension; inflammation; septic shock;

```
The cDNA encodes transforming growth factor-beta 2 (TGF-beta 2) which has been found to inhibit inducible nitric oxide synthase (INOS) gene transcription, spp. in interleukin-1-beta (ILI-beta) stimulated rat smooth muscle cells, and a dose which does not inhibit constitutive NOS. TGF-beta 1 or 2 (AAR83055) or their active fragments, can be used in the treatment of hypotension, such as that associated with severe
                                                                                                                                                                                                                                                                                 Treatment of hypotension, esp. in septic shock - by administering transforming growth factor-beta e.g. to inhibit inducible nitric oxide synthase gene transcription

A new method for treating hypertension comprises administering a transforming growth factor (TGF)-beta to an individual at a dose effective for lowering blood pressure; the TGF-beta may be e.g. mature TGF-beta, TGF-beta2, a mature TGF-beta1/beta2 hybrid, TGF-beta1 precursor, a latent TGF-beta2 precursor, hybrid TGF-beta1/TGF-complex.
                                                                                                                                 Hypertension therapy; hypotensive agent; blood pressure modulator;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             their

```

```
PolyA-RNA was isolated from the tamoxifen-treated, human prostatic adenocarcinoma cell line PC-3 and converted to cDNA. TGF DNA is used for control of the SV40 promoter and expressed in CHO cells. The simian SQ is also claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New DNA sequence encoding transforming growth factor beta used for large scale expression in eucaryotic cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2568 BP; 772 A; 597 C; 513 G; 686 T; 0 other;

The growth factor can be produced at high levels from a CHO expression system.

This DNA sequence is expressed in a host cell, preferably a COS or CHO cell, containing a recombinant vector encoding this sequence under the control of a 2nd nucleotide sequence that regulates gene expression, preferably the SV40 promoter, so the host cell produces active TGF-beta2. The produced TGF-beta2 protein can be used to regulate cellular differentiation and proliferation.
                                                              TGF-betal; TGF-betal; transforming growth factor; protein; cell differentiation; cell proliferation; CHO; Chinese hamster; ovary; COS; monkey kidney; animal; mammal; ss.

Sequence of human transforming growth factor (TGF) beta-1/TGF-beta-2
                                                                                                                                      TGF-Beta2 may be used in treatment of tumors at effective doses, and may also be useful in augmenting wound healing by stimulating cell proliferation. The growth factor can be produced at high levels from a CHO expression system.
                                                 Cloning and expression of transforming growth factor beta 2 -used for treatment of tumors or for augmenting wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   67

Hybrid transforming growth factor beta-1/TGF-beta-2 precursor - used to produce biologically active, mature TGF-beta-2

Claim 1, 2 and 3; Fig.1b; 52pp; English.

This hybrid DNA sequence is expressed in a host cell, preferably a COS or CHO cell, containing a recombinant vector encoding this sequence under the control of a 2nd nucleotide sequence that regulates gene expression, preferably the SV40 promoter, so the host cell produces active TGF-beta2. The produced TGF-beta2 protein can be used to regulate cellular differentiation and proliferation.

Sequence 2200 BP; 597 A; 588 C; 517 G; 498 T; 0 other;

Transforming growth factor; TGF; TGF-beta; TGF-5 beta; simian; Simian virus 40; SV40; expression vector; Chinese Hamster ovary; CHO; vascular endothelial cell; ss.
                                                                                                                                                                                                           Chimeric gene has TGF activity and may be more desirable than its parents TGF-betal. CHO cells expressing the product from a plasmid vector (p5beta/dhr) are 2.5 times more bioactive than normal. The product is useful in treatment of cancer and wound

```
The sequence given encodes a hybrid transforming growth factor (TGF)-beta termed TGF-beta 1/beta 2 (or TGF-5 beta). The mutations indicated in the features table represent replacements of TGF-beta 1 bases with those from the corresponding positions of TGF-beta 2. Simian codon usage was maintained. This DNA sequence could be placed
                                                                                                                                                                                                                                                                                                                                                                                                                            /*tag= o
